Countdown, Count-Up and Presentation Timer on TV

A clean timer for the room, with timing controls on your device.

A full-screen break countdown on TV with timer controls on a phone. Product example.

1. Open vuthis.com on the TV or projector

Open vuthis.com in the display browser. For a projector, use its browser or the computer already connected to it. Keep the connection code on screen.

Result: The screen is ready for a controller.

2. Connect your phone, tablet or laptop

Scan the screen QR code with your phone. On a laptop or tablet, open vuthis.com/r and enter the screen code. Both devices need internet; they can use different networks.

Result: The content controls are on your device.

3. Choose Timer and a mode

Choose Down for a set duration, Up for elapsed time or To a time for a fixed clock-time target.

Result: The timer matches the activity.

Use the controls. Check the result.

4. Set the duration or target and label

Enter the duration or finishing time. Add a label such as Break, Questions, Presentation time or Group work. Choose readable colours.

Result: The room knows what the time refers to.

5. Choose Show now and run the timer

Show the timer on the shared display. The audience sees the large timer while the controller keeps its buttons.

Result: The room can follow the time.

6. Pause, resume or restart the appropriate mode

Down and Up support Pause, Resume and Restart. To a time stays tied to the fixed target. At the end of a countdown, the timer and background colours swap.

Result: The timer follows the event rather than distracting from it.

Keep it ready for the room

- To a time stays tied to its target; it does not pause like a duration timer.

- Check the displayed value before the audience starts a timed activity.

Open the working product

Open vuthis.com on your display | Connect with the screen code
